Topic 1: Business Document Processing & Records Management

Modern Records & Information Management

Modern document management relies on systematic archiving protocols and cloud filing technology to maintain institutional memory. Records management serves as the backbone administrative retrieval.

Practical Applications:

a. **Records Retention:** Establishing retention schedules, archiving inactive files, and securely disposing of expired records.
b. **Version Control:** Preventing document duplication and ensuring team access to active working versions.
c. **Cross-Referencing:** Building master indices to locate physical and cloud files instantly.

Topic 1.Principles of Alphabetic & Numeric Filing Systems

A filing system gives records a predictable order so that employees can store and retrieve them accurately. Alphabetic filing arranges records according to names or titles, while numeric filing arranges them by assigned numbers. Staff should apply one consistent rule across the organization and check the filing guide before placing a record.

Filing Standard	Rule & Formatting Protocol
Individual Names Indexing	Names are indexed as *Last Name, First Name, Middle Initial* (e.g., *De Guzman, Nicole E.*)
Compound Surnames	Surnames with prefixes (De, La, De La) are indexed as a single unit (e.g., *John A. De La Cruz → De La Cruz, John A.*).
Business Names Indexing	Business names are indexed as written unless they contain individual names (e.g., *J. Santos Hardware → Santos, J. Hardware*).
Punctuation Rules	Hyphens, apostrophes, and commas are completely disregarded during filing sequence setup.

Numeric filing	Arrange records by their assigned number in ascending order. Use an index or cross-reference when staff need to search by a customer or subject name.

Steps in Filing and Retrieving Records:

- Inspect the document and identify its main name, subject, date, or reference number.
- Determine the correct filing category using the office filing guide.
- Prepare a clear label or digital file name.
- Place the record in the correct folder, cabinet, or authorized digital location.
- Update the index or tracking log when required.
- When retrieving a record, return it to its original location after use and maintain confidentiality.

Common Filing Errors and How to Avoid Them

Filing errors happen when documents are placed in the wrong folder, given incorrect labels, or stored using inconsistent naming rules. These errors can make records difficult to locate and may delay office tasks.

To avoid these problems, office administrators should follow the established filing rules, check document labels carefully, and return files to their correct locations after use. They should also make sure that each document is filed under the appropriate name or reference number.

Practical Example

If an employee accidentally files a document under the wrong client's name, other staff may have difficulty finding it. Checking the client's name before filing can help prevent this mistake.

Key Takeaway

Consistent filing procedures help keep office records organized and easy to retrieve.

Topic 2. Standard Business Memo Formatting

A memorandum, or memo, is a short formal document used mainly for internal communication. It may announce a policy, provide an update, request action, record a decision, or communicate instructions. A good memo is direct, organized, and easy for the intended readers to understand.

Memo Header Element	Definition & Requirements
TO:	Identifies the full name and job title of the intended recipient(s).
FROM:	States the author's full name, title, or administrative office.
DATE:	Formatted completely as Month Day, Year (e.g., October 20,2026
Memo Header Element	Definition & Requirements
SUBJECT:	Concise title describing the exact internal issues or update discussed
Opening	Briefly explain the reason for the memo.
Body	Provide relevant facts, instructions, deadlines, and supporting details in a logical order.
Closing / Action	State what the reader should do next, if action is required.

Sample Business Memo

TO: All Office Administration Staff
FROM: Office Administration Coordinator
DATE: October 20, 2026
SUBJECT: Updated Digital Filing Procedure
Beginning October 21, all newly created office records must be saved in the designated department folder using the approved file-naming convention. Staff should avoid creating duplicate copies and must use version numbers when revising shared documents. Please review existing files and report any misplaced or unclear records to the coordinator by October 28.

When to Use a Business Memo

A business memo is commonly used for internal communication within an organization. It can be used to announce office policies, provide instructions, share important updates, or document decisions that employees need to know.

Before writing a memo, the sender should identify its purpose and intended readers. The message should be clear, direct, and organized so employees can easily understand the information.

Practical Example

An office administrator may prepare a memo to inform employees about a change in office hours or a new procedure for submitting documents.

Key Takeaway

Using a memo for appropriate internal communication helps ensure that important office information is communicated clearly.

Topic 3. Digital Records & Clouds Storage Standards

Digital records management applies the same principles of organization and accountability to electronic files. Cloud platforms such as Google Drive and Microsoft OneDrive allow authorized team members to access and collaborate on documents. However, files must be named consistently, stored in the correct folders, and protected through appropriate sharing permissions.

Digital Practice	Standards Operating Procedure
File Naming Convention	Standardize names using YYYY-MM-DD_DocType_Topic_v1 (e.g., 2026-10-20_Memo_AuditSchedule_v1.pdf).
Version Control	Append incremental version tags (_v1, _v2) rather than naming files "FINAL" or "NEW".
Folder Hierarchy	Organize logically by *Year > Department > Sub-Category > File*.
Cloud permissions	Give access only to people who need the document; review sharing permissions for confidential records.
Backup and recovery	Follow organizational backup procedures and confirm that important files can be recovered when necessary.
Secure disposal	Delete or archive records only in accordance with the approved retention policy.
